Table 2.9: Table of Classification Accuracy for Gaussian Mixture Model

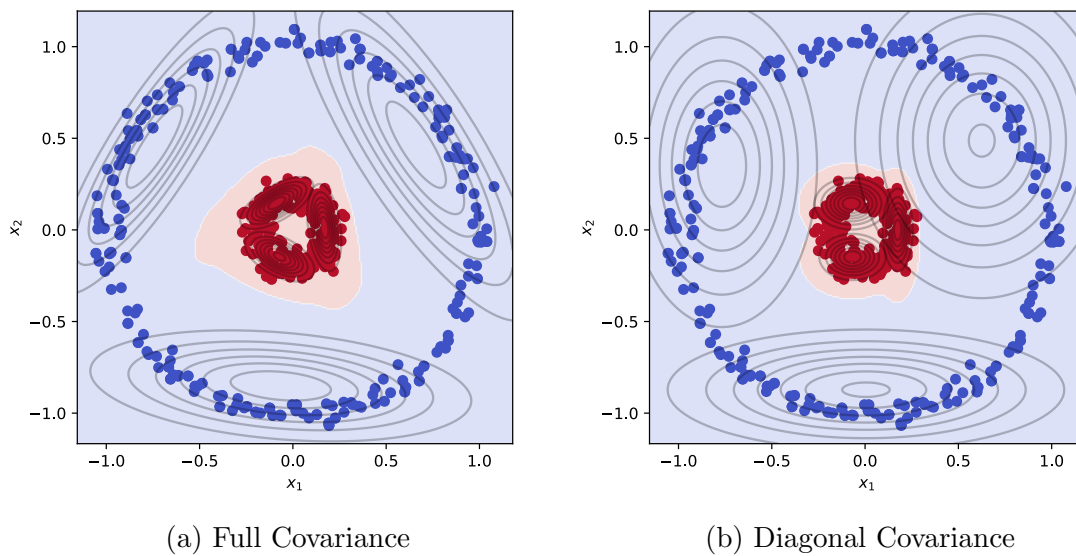

Figure 2.5: Plot of Decision Boundary for best Gaussian Mixture Model

Graphs for all the nodes of hidden layer 1 after 1 epoch, 5 epochs and 20 epochs

Graphs for all the nodes of hidden layer 2 after 1 epoch, 5 epochs and 20 epochs

Epoch :1, Output layer, Node: 1

Epoch :1, Output layer, Node: 2

Epoch :5, Output layer, Node: 1

Epoch :5, Output layer, Node: 2

Epoch :20, Output layer, Node: 1

Epoch :20, Output layer, Node: 2

Graphs for all the nodes of output layer after 1 epoch, 5 epochs and 20 epochs

Observations

- 1) The best configuration model converges in very few no. of epochs (5 to 10). That's why we see similar plots for nodes for 5th and 10th epoch.
- 2) As we took ReLU activation functions for hidden layers ,this is clearly visible in the plots.
- 3) Looking at output layer node plots , the outer set of data points have greater values in node 1 than in node 2 . That's why they are classified as class 0 data points by the model. It goes similarly for the inner set as well.
- 4) As the model converges the steepness increases in the output layer nodes plot.
